

# VCU Discrete Mathematics Seminar

## *Bipartite Edge-Transitive Products*

**Cameron Crenshaw**  
**VCU!**

Wed., May 3  
1:00-1:50  
4119 Harris Hall

In their recent paper "Edge-transitive products," Hammack, Imrich, and Klavzar showed that the direct product of connected, non-bipartite graphs is edge-transitive if and only if both factors are edge-transitive, and at least one is arc-transitive. However, little is known when the product is bipartite. We extend this result (in part) for the case of bipartite graphs using a new technique we call "stacking." For  $R$ -thin, connected, bipartite graphs  $A$  and  $B$ , we show that  $A \times B$  is arc-transitive if and only if  $A$  and  $B$  are both arc-transitive. Further, we show  $A \times B$  is edge-transitive only if at least one of  $A$ ,  $B$  is also edge-transitive, and give evidence that strongly suggests that in fact both factors must be edge-transitive.
