

Gödel, Escher, and Bach (Spring 2001)

How to find a person's name in the telephone book

Use two machines:

Assume existence of the machine called *Midpoint* (like a rule of production):

Input: list of names

Output: Midpoint name (how? Count backwards and forwards)

Use *Midpoint* to find specific name in the telephone book

CALL *FindName* (telephone book, a person's name) → output of function

WRITE output of function

FUNCTION *FindName* (*List*, *Target*)

CALL *Midpoint* (*List*) → output of function

WRITE output of *Midpoint* in Box called *Intermediate*

COMPARE: *Target* to *Intermediate* (LESS THAN, EQUAL TO, or GREATER THAN)

IF LESS THAN then

ERASE names from *Intermediate* onwards from *List*

IF GREATER THAN then

ERASE names from first name to *Intermediate* from *List*

IF EQUAL TO then

OUTPUT List entry (e.g. telephone number) for *List*

EXIT FUNCTION

CALL *FindName* (*List*, *Target*) → output of function (a name)

END OF FUNCTION
