

# List-coloring the Square of a Subcubic Graph

Daniel Cranston and Seog-Jin Kim

[dcransto@uiuc.edu](mailto:dcransto@uiuc.edu)

University of Illinois, Urbana-Champaign

list assignment  $L$ :  $L(v)$  is the set of colors available at vertex  $v$

list assignment  $L$ :  $L(v)$  is the set of colors available at vertex  $v$

$L$ -coloring: proper coloring where each vertex gets a color from its assigned list

**list assignment  $L$ :**  $L(v)$  is the set of colors available at vertex  $v$

**$L$ -coloring:** proper coloring where each vertex gets a color from its assigned list

**$k$ -choosable:** there exists an  $L$ -coloring whenever all  $|L(v)| \geq k$

**list assignment  $L$ :**  $L(v)$  is the set of colors available at vertex  $v$

**$L$ -coloring:** proper coloring where each vertex gets a color from its assigned list

**$k$ -choosable:** there exists an  $L$ -coloring whenever all  $|L(v)| \geq k$

**$\chi_l(G)$ :** minimum  $k$  such that  $G$  is  $k$ -choosable

**list assignment**  $L$ :  $L(v)$  is the set of colors available at vertex  $v$

**$L$ -coloring**: proper coloring where each vertex gets a color from its assigned list

**$k$ -choosable**: there exists an  $L$ -coloring whenever all  $|L(v)| \geq k$

$\chi_l(G)$ : minimum  $k$  such that  $G$  is  $k$ -choosable

**list assignment  $L$ :**  $L(v)$  is the set of colors available at vertex  $v$

**$L$ -coloring:** proper coloring where each vertex gets a color from its assigned list

**$k$ -choosable:** there exists an  $L$ -coloring whenever all  $|L(v)| \geq k$

**$\chi_l(G)$ :** minimum  $k$  such that  $G$  is  $k$ -choosable

**$G^2$  (square of  $G$ ):** formed from  $G$  by adding edges between vertices at distance 2.

Conjecture [Wegner 1977]

If  $G$  is planar and  $\Delta(G) = 3$ , then  $\chi(G^2) \leq 7$ .

## Conjecture [Wegner 1977]

If  $G$  is planar and  $\Delta(G) = 3$ , then  $\chi(G^2) \leq 7$ .

## Theorem [Thomassen 2007]

Wegner's conjecture for  $\Delta(G) = 3$  is true.

Conjecture [Wegner 1977]

If  $G$  is planar and  $\Delta(G) = 3$ , then  $\chi(G^2) \leq 7$ .

Theorem [Thomassen 2007]

Wegner's conjecture for  $\Delta(G) = 3$  is true.

Conjecture [Kostochka & Woodall 2001]

$\chi_l(G^2) = \chi(G^2)$  for every graph  $G$ .

### Conjecture [Wegner 1977]

If  $G$  is planar and  $\Delta(G) = 3$ , then  $\chi(G^2) \leq 7$ .

### Theorem [Thomassen 2007]

Wegner's conjecture for  $\Delta(G) = 3$  is true.

### Conjecture [Kostochka & Woodall 2001]

$\chi_l(G^2) = \chi(G^2)$  for every graph  $G$ .

$\implies \chi_l(G^2) \leq 7$  if  $G$  is planar and  $\Delta(G) = 3$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 9$ , then  $\chi_l(G^2) \leq 6$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

### Theorem 3:

If  $\Delta(G) = 3$  and  $G$  is not the Petersen graph, then  $\chi_I(G^2) \leq 8$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

### Theorem 3:

If  $\Delta(G) = 3$  and  $G$  is not the Petersen graph, then  $\chi_I(G^2) \leq 8$ .

### Plan

- ▶ get an upper bound on  $\bar{d}(G)$

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

### Theorem 3:

If  $\Delta(G) = 3$  and  $G$  is not the Petersen graph, then  $\chi_I(G^2) \leq 8$ .

### Plan

- ▶ get an upper bound on  $\bar{d}(G)$
- ▶ consider a minimal counterexample  $G$

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , and  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

### Theorem 3:

If  $\Delta(G) = 3$  and  $G$  is not the Petersen graph, then  $\chi_I(G^2) \leq 8$ .

### Plan

- ▶ get an upper bound on  $\bar{d}(G)$
- ▶ consider a minimal counterexample  $G$
- ▶ list forbidden subgraphs

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , and girth  $\geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , and girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

### Theorem 3:

If  $\Delta(G) = 3$  and  $G$  is not the Petersen graph, then  $\chi_I(G^2) \leq 8$ .

### Plan

- ▶ get an upper bound on  $\bar{d}(G)$
- ▶ consider a minimal counterexample  $G$
- ▶ list forbidden subgraphs
- ▶ use discharging to show that if  $G$  does not contain any forbidden subgraph, then the bound on  $\bar{d}(G)$  does not hold

Lemma 4:

If  $G$  is planar and has girth  $g$ , then

$$\bar{d}(G) < \frac{2g}{g-2}$$

### Lemma 4:

If  $G$  is planar and has girth  $g$ , then

$$\bar{d}(G) < \frac{2g}{g-2}$$

Proof:

$$e + 2 = v + f$$

### Lemma 4:

If  $G$  is planar and has girth  $g$ , then

$$\bar{d}(G) < \frac{2g}{g-2}$$

Proof:

$$e + 2 = v + f$$

$$e < v + f$$

### Lemma 4:

If  $G$  is planar and has girth  $g$ , then

$$\bar{d}(G) < \frac{2g}{g-2}$$

Proof:

$$e + 2 = v + f$$

$$e < v + f$$

$$e < \frac{2e}{\bar{d}} + \frac{2e}{g}$$

### Lemma 4:

If  $G$  is planar and has girth  $g$ , then

$$\bar{d}(G) < \frac{2g}{g-2}$$

Proof:

$$e + 2 = v + f$$

$$e < v + f$$

$$e < \frac{2e}{\bar{d}} + \frac{2e}{g}$$

$$\bar{d} < \frac{2g}{g-2}$$

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 5:

If  $G$  is a minimal counterexample to Theorem 1, then  $G$  does not contain any of the following 5 subgraphs:

### Corollary 6:

Let  $M_1(v)$  and  $M_2(v)$  denote the number of 2-vertices at distance 1 and 2 from  $v$ .

If  $v$  is a:

2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ ,  $\text{girth} \geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_I(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

Say  $G$  is a minimal counterexample to Theorem 1.

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

Say  $G$  is a minimal counterexample to Theorem 1.

Lemma 4 says  $\bar{d}(G) < \frac{2(7)}{7-2} = 2\frac{4}{5}$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

Say  $G$  is a minimal counterexample to Theorem 1.

Lemma 4 says  $\bar{d}(G) < \frac{2(7)}{7-2} = 2\frac{4}{5}$ .

We will show  $\bar{d}(G) \geq 2\frac{4}{5}$ , which gives a contradiction.

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

Say  $G$  is a minimal counterexample to Theorem 1.

Lemma 4 says  $\bar{d}(G) < \frac{2(7)}{7-2} = 2\frac{4}{5}$ .

We will show  $\bar{d}(G) \geq 2\frac{4}{5}$ , which gives a contradiction.

We use a discharging argument with  $\mu(v) = d(v)$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Lemma 4:

If  $G$  is planar and has girth  $\geq g$ , then  $\bar{d}(G) < \frac{2g}{g-2}$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

2-vertex:

3-vertex:

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

2-vertex:  $2 + 2(\frac{1}{5}) + 4(\frac{1}{10}) = 2\frac{4}{5}$

3-vertex:

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

2-vertex:  $2 + 2(\frac{1}{5}) + 4(\frac{1}{10}) = 2\frac{4}{5}$

3-vertex:  $3 - \frac{1}{5}M_1(v) - \frac{1}{10}M_2(v)$

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

2-vertex:  $2 + 2(\frac{1}{5}) + 4(\frac{1}{10}) = 2\frac{4}{5}$

3-vertex:  $3 - \frac{1}{5}M_1(v) - \frac{1}{10}M_2(v)$   
 $= 3 - \frac{1}{10}(2M_1(v) + M_2(v))$

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

2-vertex:  $2 + 2(\frac{1}{5}) + 4(\frac{1}{10}) = 2\frac{4}{5}$

3-vertex:  $3 - \frac{1}{5}M_1(v) - \frac{1}{10}M_2(v)$   
 $= 3 - \frac{1}{10}(2M_1(v) + M_2(v))$   
 $\geq 3 - \frac{1}{10}(2)$

### Theorem 1:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 7$ , then  $\chi_l(G^2) \leq 7$ .

### Corollary 6:

If  $v$  is a 2-vertex, then  $M_1(v) = M_2(v) = 0$ .

3-vertex, then  $2M_1(v) + M_2(v) \leq 2$ .

### Proof of Theorem 1:

We use a discharging argument with  $\mu(v) = d(v)$ .

- ▶ Each 3-vertex gives  $\frac{1}{5}$  to each 2-vertex at distance 1.
- ▶ Each 3-vertex gives  $\frac{1}{10}$  to each 2-vertex at distance 2.

Show that  $\mu^*(v) \geq 2\frac{4}{5}$  for each vertex  $v$ .

2-vertex:  $2 + 2(\frac{1}{5}) + 4(\frac{1}{10}) = 2\frac{4}{5}$

3-vertex:  $3 - \frac{1}{5}M_1(v) - \frac{1}{10}M_2(v)$   
 $= 3 - \frac{1}{10}(2M_1(v) + M_2(v))$   
 $\geq 3 - \frac{1}{10}(2)$   
 $= 2\frac{4}{5}$

## Lemma 7:

If  $G$  is a minimal counterexample to Theorem 2,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 7:

If  $G$  is a minimal counterexample to Theorem 2,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 7:

If  $G$  is a minimal counterexample to Theorem 2, then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 7:

If  $G$  is a minimal counterexample to Theorem 2,  
then  $G$  does not contain any of the following 5 subgraphs:

### Lemma 8:

If  $G$  is a minimal counterexample to Theorem 2, then  $G$  does not contain the following as a subgraph:

### Lemma 8:

If  $G$  is a minimal counterexample to Theorem 2, then  $G$  does not contain the following as a subgraph:

### Lemma 8:

If  $G$  is a minimal counterexample to Theorem 2, then  $G$  does not contain the following as a subgraph:

Lemma 8:

If  $G$  is a minimal counterexample to Theorem 2, then  $G$  does not contain the following as a subgraph:

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ ,  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ ,  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ ,  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ ,  $\text{girth} \geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

We use discharging with an initial charge  $\mu(v) = d(v)$ .

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

We use discharging with an initial charge  $\mu(v) = d(v)$ .

We have three discharging rules.

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_l(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

We use discharging with an initial charge  $\mu(v) = d(v)$ .

We have three discharging rules.

R1) Each 3-vertex gives  $\frac{2}{7}$  to each adjacent 2-vertex.

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

We use discharging with an initial charge  $\mu(v) = d(v)$ .

We have three discharging rules.

R1) Each 3-vertex gives  $\frac{2}{7}$  to each adjacent 2-vertex.

R2) Each class 0 vertex gives  $\frac{1}{7}$  to each adjacent 3-vertex.

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

We use discharging with an initial charge  $\mu(v) = d(v)$ .

We have three discharging rules.

R1) Each 3-vertex gives  $\frac{2}{7}$  to each adjacent 2-vertex.

R2) Each class 0 vertex gives  $\frac{1}{7}$  to each adjacent 3-vertex.

R3) Each class 1 vertex gives  $\frac{1}{7}$  to each class 2 vertex at dist. 1.  
gives  $\frac{1}{7}$  to each class 3 vertex at dist. 2.

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

By Lemma 4, we know that  $\bar{d}(G) < \frac{2(9)}{9-2} = 2\frac{4}{7}$ .

We will use discharging to show that  $\bar{d}(G) \geq 2\frac{4}{7}$ .

**Def:** a 3-vertex is class  $i$  if it is adjacent to  $i$  2-vertices.

We use discharging with an initial charge  $\mu(v) = d(v)$ .

We have three discharging rules.

R1) Each 3-vertex gives  $\frac{2}{7}$  to each adjacent 2-vertex.

R2) Each class 0 vertex gives  $\frac{1}{7}$  to each adjacent 3-vertex.

R3) Each class 1 vertex gives  $\frac{1}{7}$  to each class 2 vertex at dist. 1.  
gives  $\frac{1}{7}$  to each class 3 vertex at dist. 2.

We need to show that  $\mu^*(v) \geq 2\frac{4}{7}$  for each vertex  $v$ .

## Theorem 2:

If  $G$  is planar,  $\Delta(G) = 3$ , girth  $\geq 9$ , then  $\chi_I(G^2) \leq 6$ .

## Proof of Theorem 2:

We use discharging with an initial charge  $\mu(v) = d(v)$ .
