

# **Introduction to Bioinformatics**

## **Material for Final Exam**

Questions for each of the exams will taken (with some modification) from the various Problem Sets, Study Questions, and tours covered since the beginning of the semester, as well as from topics drawn from your particular research project and articles deemed related to it.

My purpose in this exam will be to assess your current abilities to use computation to address biological problems and to use the scientific literature to provide context to your efforts. Don't expect picky questions on introductory matters from months ago. Do expect questions that will examine the bottom line: What are you able to do?
